

Group Six

Paper Prototype Testing Packet

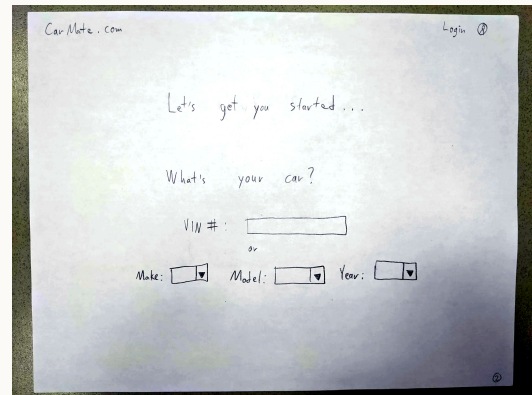

Prototype photos, user briefing, scenario task cards, and observations from testing.

Section 1

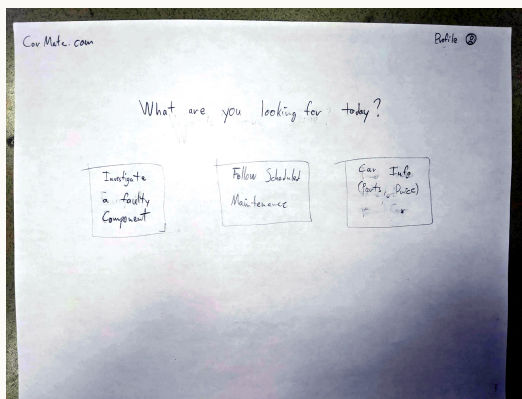

Prototype Photos

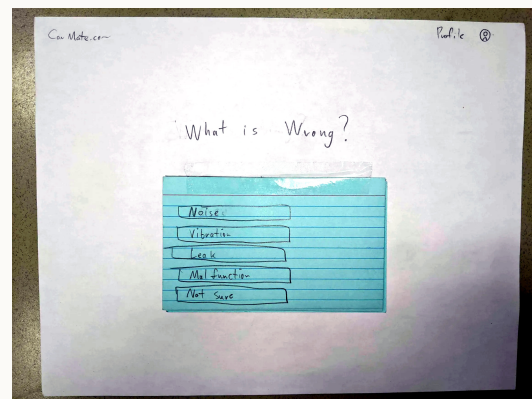

Landing view with a visible get started entry point.

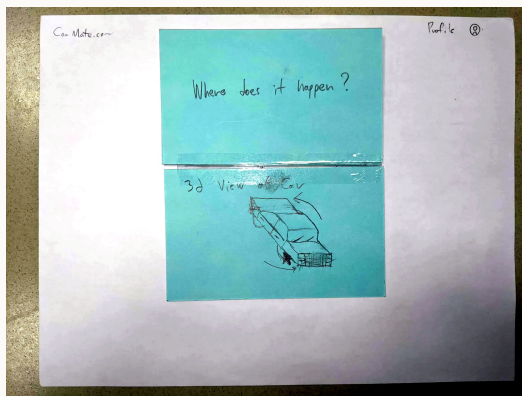

Car information form with basic vehicle details.

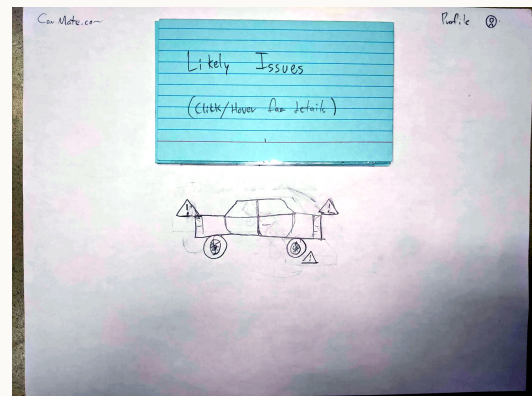

Car info flow with next-step options after setup.

Maintenance schedule/timeline concept.

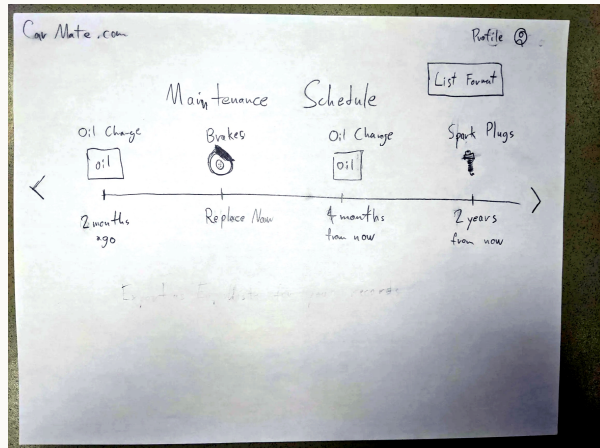

Diagnosis follow-up card for issue details.

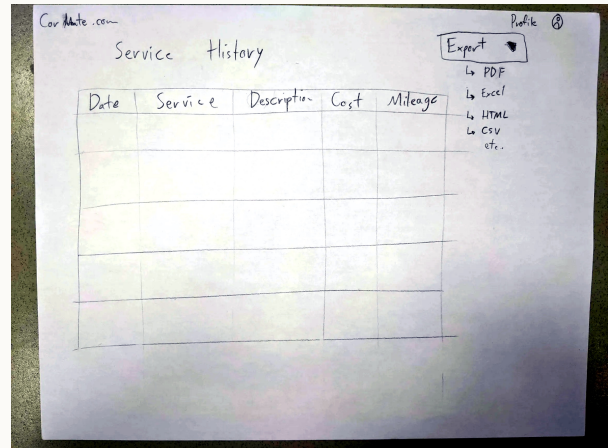

Vehicle diagram sketch used during diagnosis.

Section 1

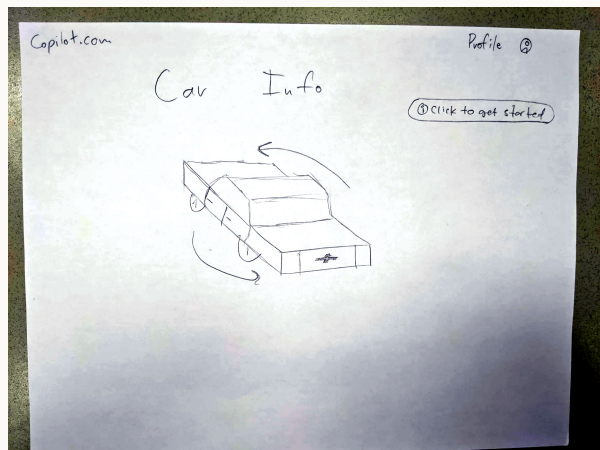

Prototype Photos

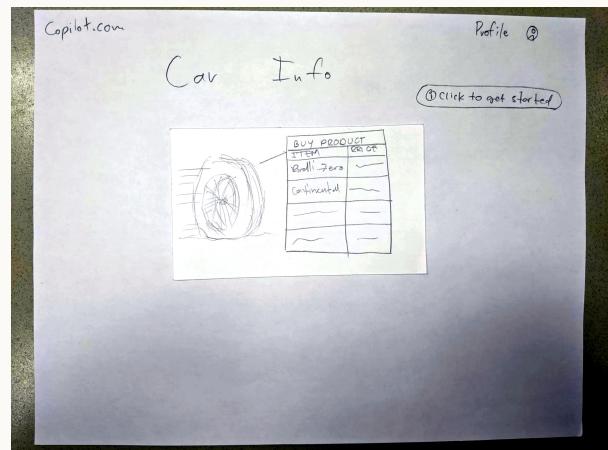

Maintenance overview with navigation choices.

Service history table concept for past work.

3D-style car parts selection view.

Zoomed-in product part shopping view after selecting a car part.

Section 2

Briefing

This is the briefing page given to users before they started the prototype test.

Car Maintenance & Info Webpage – Test User Briefing

Purpose of the App

- Help everyday drivers understand and manage their car maintenance
- Provide clear, personalized maintenance schedules based on your vehicle
- Give quick insights like car value and upcoming service needs
- Reduce confusion, unexpected repairs, and unnecessary costs

Why This Matters

- Many drivers don't track maintenance well or rely on scattered info (Google, notes, memory)
- Missing maintenance can lead to expensive repairs
- Mechanics may suggest services that are hard to verify without knowledge
- There's no simple, centralized place to manage everything

What the App Focuses On

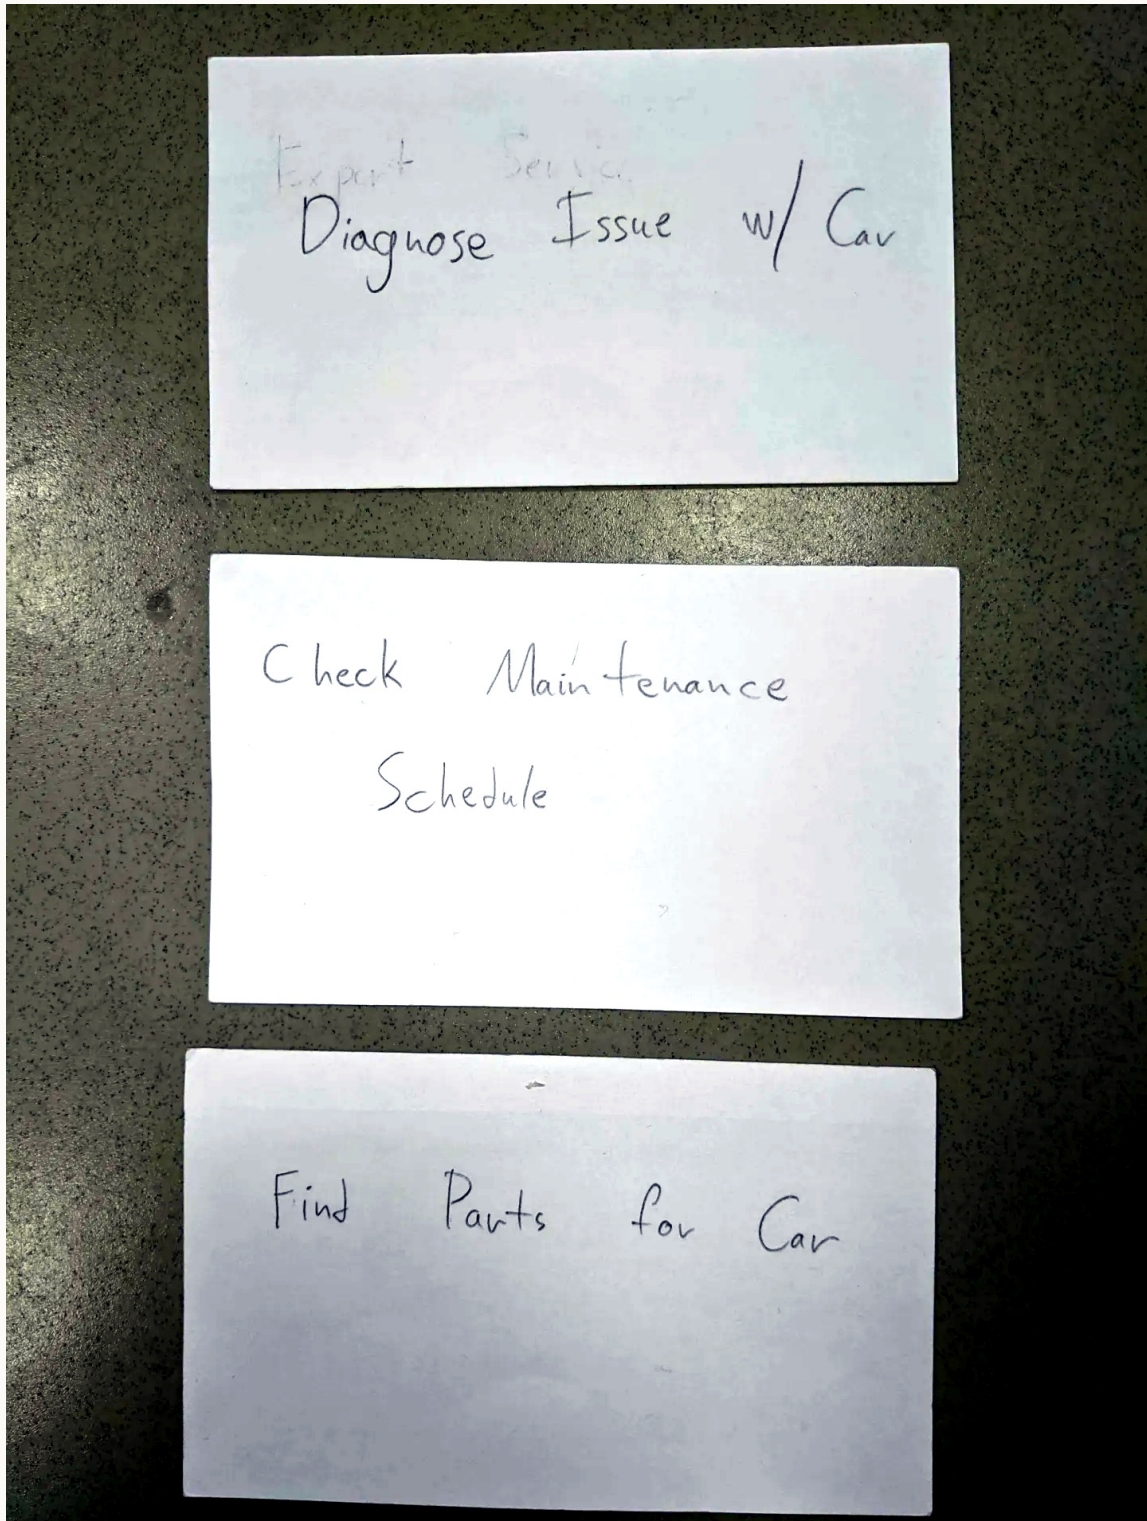

- Turning complex car info into simple, understandable insights
- Helping users stay ahead of maintenance, not react to problems
- Supporting both:
 - Beginners (little car knowledge)
 - More experienced users (want detailed info)

Grammar and document style was assisted by Google Doc's AI Assistant (Gemini).

Section 3

Scenario Tasks

Task cards used during testing. The cards asked users to diagnose an issue, check the maintenance schedule, and find parts for a car.

Section 4

Observations

Usability problems found during paper-prototype testing by participants.

Onboarding and account entry. Several users started with the get started path, but some quickly wanted a clearer login option instead. They also expected a more explicit submit action after entering vehicle information.

Vehicle information form clarity. Users could move through the car information questions, but they asked for help text on inputs such as the VIN field and wanted the form to explain what each value meant before continuing.

Diagnosis flow and issue reporting. Once users reached the guided questions, they moved quickly and said the information felt easy to access. At the same time, they wanted the option to type a custom issue instead of only choosing from preset paths like leakage.

3D model discoverability. Users were unsure where to hover or click in the 3D view, and some said it was difficult to tell where a car problem should be located. They asked for more visible controls and clearer click targets.

Maintenance schedule comprehension. The maintenance schedule caused the most confusion. Users had trouble telling what was done, due now, or due later, and they said the list/timeline view made history and future items hard to track.

Navigation and follow-up actions. Multiple users wanted back buttons from menus, form responses, and the maintenance area so they could recover from earlier choices. They also suggested practical follow-up actions such as exporting details, emailing information, updating car data, using presets, or seeing a nearby car-parts shop.

Section 5

Prototype Iteration

Between the first and second paper-prototype rounds, we made a small set of focused changes instead of trying to address every comment at once. We simplified the landing page, added a clearer login path, and made the vehicle setup flow feel more explicit with a submit action and short input hints such as VIN guidance.

We also revised the maintenance area so it better separated completed work, current items, and upcoming items, because that was the most common source of confusion in round one. For navigation, we added back buttons in the menu and form flow and included a more obvious return path from the maintenance screens back to the 3D view.

We still have some suggestions for later versions like including export by email, presets, and nearby parts-shop suggestions.
